Laboratory Biosecurity Training

Laboratory Biosecurity Training Available on CDC web site at:
www.cdc.gov/odohs/biosecurity_trainingindex.html

This training describes key principles for securing biological agents in research laboratories and biomedical facilities where loss, theft, release or intentional misuse of the agent might have significant public health or economic consequences. After completing this training you should be able to:

- Describe the basis for laboratory biosecurity planning for microbiological laboratories.
- Differentiate between biosafety and biosecurity.
- Describe how to conduct a risk assessment.
- Describe the components of a biosecurity plan.

Successful biosecurity programs should have full support from all levels of management, be site-specific, and be based on an understanding of facility assets and needs. Identifying which agents and infrastructure need to be protected is an individual organization's management decision. Biosecurity programs should apply corresponding security measures by using a graded approach to reduce risk to an acceptable level.
